SafeToy

Every question matters. Every language deserves to be understood.

An intelligent, screen-free AI voice companion for children • Powered by Gnani AI

The Problem

Children ask a hundred questions a day — *Why is the sky blue? How do birds fly? Can we go to the moon?* — but busy parents and unavailable teachers mean many questions go unanswered, and curiosity fades. Most AI toys only make this worse: they are built for English-speaking children, while Indian children naturally speak Hindi, Hinglish, and regional languages.

Our Solution

SafeToy is a screen-free voice companion that answers a child's questions in their own language, in a friendly, natural voice. No screen, no typing — just conversation. When a child asks, *"Chand pe hum kaise ja sakte hain?"*, SafeToy understands the Hinglish question and replies in simple Hindi, just as a patient friend would.

Powered by Gnani AI: At its core are two Gnani AI technologies. **Prisma** understands the child's natural speech across Hindi, Hinglish, and mixed language use. **Timbre** turns the response into natural, human-like speech. Integrated into real hardware, SafeToy responds in **under 2.4 seconds** — fast enough to keep a child's curiosity alive. **Prisma understands the child, and Timbre gives that understanding a voice.**

Built for trust: Making an AI that talks is easy; making one parents can trust is the real challenge. SafeToy uses **hardware-controlled listening** — the microphone activates only when the child presses the physical button. Both incoming questions and AI responses are checked for unsafe content, so every conversation stays age-appropriate and safe.

Emotion intelligence: SafeToy goes beyond answering. We built our own emotion dataset of **28,287 examples across seven emotions** and trained a custom emotion classification model. If a child says, *"Mujhe darr lag raha hai,"* SafeToy recognises the fear and responds more gently, adapting to the child's emotional context.

For parents: Parents get more than chat logs. Our parent dashboard provides insights into new words learned, topics of interest, learning patterns, and emotional expressions — so parents stay connected to what their child is curious about, learning, and feeling, without needing a screen in the child's hands.

Together, Gnani AI's Prisma and Timbre, our custom safety framework, emotion intelligence, and parent dashboard make SafeToy more than an AI toy. The future of AI should not be limited by language, screens, or accessibility — **every child deserves technology that understands them.** SafeToy brings intelligent, trusted conversation closer to India's next generation.

SafeToy — Every question matters. Every language deserves to be understood.

Thank you!
